This manual explains how to use the SIGOP-III signal optimization computer program. The program, which is written in FORTRAN, is designed to generate traffic signal timing plans for both grid networks and arterials. The program not only optimizes splits and offsets, and selects the optimum cycle length, it also outputs time-space diagrams. In addition to the normal measures of effectiveness associated with traffic flow, estimates of fuel consumption and vehicle emissions are provided. InfoWorld is targeted to Senior IT professionals. Microsoft Virtual Server 2005 allows a single server to be divided into several "virtual machines," each running its own environment and operating system, which can even be virtually networked together. Written by a key member of Microsoft's Virtual Server product team, this guide shows programmers how they can use these virtual machines to keep their development environment separate from their computing environment, test software on a variety of platforms from a single machine, and test networking applications. Packed with real-world examples, the book examines how to install Linux under Virtual Server, create VM libraries, tweak performances, troubleshoot installation glitches,

and access the Virtual Server COM API Offers a clear explanation of how to best understand virtual devices, networks, and storage systems and handle debugging in virtual machines This book offers a comprehensive guide to Novell's Linux Enterprise Server, one of the most powerful Linux-based server solutions available today. The book guides readers through all of the most important aspects of SLES, beginning with an in-depth overview of installation and configuration tasks. Later chapters cover configuration and deployment of key services, including the MySQL database, file sharing and printing, Web, FTP, News, DNS, and Proxy Servers. van Vugt instructs readers on important administration concepts such as instituting strict file system security and server automation. Readers will also learn about how to cluster servers together to lessen downtime and increase performance. Readers are responsible for designing, implementing and managing the voice, data and video systems their companies use to support everything from business critical applications to employee collaboration and electronic commerce. For the last 20 years the dominant form of user interface has been the Graphical User Interface (GUI) with direct manipulation. As software gets more complicated and more and more inexperienced users come into contact with computers, enticed by the World Wide Web and smaller mobile devices, new interface metaphors are required. The increasing complexity of software has introduced more options to the user. This seemingly increased control actually decreases control as the number of options and features available to them overwhelms the users and 'information overload' can occur (Lachman, 1997). Conversational anthropomorphic interfaces provide a possible alternative to the direct manipulation metaphor. The aim of this paper is to investigate users reactions and assumptions when interacting with anthropomorphic agents. Here we consider how the level of anthropomorphism exhibited by the character and the level of interaction affects these assumptions. We compared characters of different levels of anthropomorphic abstraction, from a very abstract character to a realistic yet not human character. As more software is released for general use with anthropomorphic interfaces there seems to be no consensus of what the characters

should look like and what look is more suited for different applications. Some software and research opts for realistic looking characters (for example, Haptik Inc., see <http://www.haptik.com>). others opt for cartoon characters (Microsoft, 1999) others opt for floating heads (Dohi & Ishizuka, 1997; Takama & Ishizuka, 1998; Koda, 1996; Koda & Maes, 1996a; Koda & Maes, 1996b).
