Despite the traditional opposition between play and work, games and their structure are increasingly used in workplaces. This phenomenon of using game elements or mechanisms in other contexts than games is named "gamification". In workplaces, the gamification is supposed to abolish the separation between work and leisure or between constraint and pleasure. This book reviews a century of game theories in the social sciences and analyzes the uses of games in workplaces. We critically question the explicit functions (learning, experimentation...) which are supposed to be conveyed by games. Finally, we show that game, understood as a structure, could have efficient social functions in the workplace. With a Haynes manual, you can do it yourself? from simple maintenance to basic repairs. Haynes writes every book based on a complete teardown of the motorcycle. We learn the best ways to do a job and that makes it quicker, easier and cheaper for you. Most innovations in the car industry are based on software and electronics, and IT will soon constitute the major production cost factor. It seems almost certain that embedded IT security will be crucial for the next generation of applications. Yet whereas software safety has become a relatively well-established field, the protection of automotive IT systems against manipulation or intrusion has only recently started to emerge. Lemke, Paar, and Wolf collect in this volume a state-of-the-art overview on all aspects relevant for IT security in automotive applications. After an introductory chapter written by the editors themselves, the contributions from experienced experts of different disciplines are structured into three parts. "Security in the Automotive Domain" describes applications for which IT security is crucial, like immobilizers, tachographs, and software updates. "Embedded Security Technologies" details security technologies relevant for automotive applications, e.g., symmetric and asymmetric cryptography, and wireless security. "Business Aspects of IT Systems in Cars" shows the need for embedded security in novel applications like location-based navigation systems and personalization. The first book in this area of fast-growing economic and scientific importance, it is indispensable for both researchers in software or embedded security and professionals in the automotive industry.
