Annual Report

The International Conference on Industrial Engineering and Engineering Management is sponsored by the Chinese Industrial Engineering Institution, CMES, which is the only national-level academic society for Industrial Engineering. The conference is held annually as the major event in this arena. Being the largest and the most authoritative international academic conference held in China, it provides an academic platform for experts and entrepreneurs in the areas of international industrial engineering and management to exchange their research findings. Many experts in various fields from China and around the world gather together at the conference to review, exchange, summarize and promote their achievements in the fields of industrial engineering and engineering management. For example, some experts pay special attention to the current state of the application of related techniques in China as well as their future prospects, such as green product design, quality control and management, supply chain and logistics management to address the need for, amongst other things low-carbon, energy-saving and emission-reduction. They also offer opinions on the outlook for the development of related techniques. The proceedings offers impressive methods and concrete applications for experts from colleges and universities, research institutions and enterprises who are engaged in theoretical research into industrial engineering and engineering management and its applications. As all the papers are of great value from both an academic and a practical point of view, they also provide research data for international scholars who are investigating Chinese style enterprises and engineering

management. A comprehensive reference on the Bellman function method and its applications to various topics in probability and harmonic analysis. This book constitutes the proceedings of the 18th International Workshop on Combinatorial Image Analysis, IWCIA 2017, held in Plovdiv, Bulgaria, in June 2017. The 27 revised full papers presented were carefully reviewed and selected from 47 submissions. The workshop is organized in topical sections of theoretical foundations and theory of applications, namely: discrete geometry and topology; tilings and patterns; grammars, models and other technical tools for image analysis; image segmentation, classification; reconstruction; compression; texture analysis; bioimaging. The relationship between rational choice theory and large-scale data analysis has become an important issue for sociologists. Though rational choice theory is well established in both sociology and economics, its influence on quantitative empirical sociology has been surprisingly limited. This book examines why there is hardly a link between the two. A research journal devoted to the publication of high quality articles in formal syntax, semantics and phonology. This volume emerges from a partnership between the American Federation of Teachers and the Learning Research and Development Center at the University of Pittsburgh. The partnership brought together researchers and expert teachers for intensive dialogue sessions focusing on what each community knows about effective mathematical learning and instruction. The chapters deal with the research on, and conceptual analysis of, specific arithmetic topics (addition, subtraction, multiplication, division, decimals, and fractions) or with overarching themes that pervade the early curriculum and constitute the links with the more advanced topics of mathematics (intuition, number sense, and estimation). Serving as a link between the communities of cognitive researchers and mathematics educators, the book capitalizes on the recent research successes of cognitive science and reviews the literature of the math education community as well. This collection presents various approaches to analytic problems that arise in the context of singular spaces. It contains articles offering introductions to various pseudodifferential

calculi and discussions of relations between them, plus invited papers from mathematicians who have made significant contributions to this field. The authors systematically apply rational choice theory in order to suggest hypotheses about political protest. They test these hypotheses by means of surveys and compare their rational choice hypotheses with competing hypotheses.

*Complex Analysis: Conformal Inequalities and the Bieberbach Conjecture* discusses the mathematical analysis created around the Bieberbach conjecture, which is responsible for the development of many beautiful aspects of complex analysis, especially in the geometric-function theory of univalent functions. Assuming basic knowledge of complex analysis and differential equations, the book is suitable for graduate students engaged in analytical research on the topics and researchers working on related areas of complex analysis in one or more complex variables. The author first reviews the theory of analytic functions, univalent functions, and conformal mapping before covering various theorems related to the area principle and discussing Löwner theory. He then presents Schiffer's variation method, the bounds for the fourth and higher-order coefficients, various subclasses of univalent functions, generalized convexity and the class of  $\alpha$ -convex functions, and numerical estimates of the coefficient problem. The book goes on to summarize orthogonal polynomials, explore the de Branges theorem, and address current and emerging developments since the de Branges theorem. In 1802 Beethoven made a striking declaration to his publisher that he had adopted a completely new manner in his two latest sets of piano variations, Op. 34 and 35, and consequently numbered them among his greater musical works. Four sets of Beethoven's theme and variations for solo piano from different stylistic periods are studied: WoO76 from 1799 has been regarded as a model of Op. 34 and 35 in the mediant key relationships (Op. 34) and in the culminating movements---the adagio and fugal finale (Op. 35), which are, in his own words, completely new and different from his earlier variation works, in a manner anticipative of the Diabelli Variations, Op. 120. Stylistic features and development demonstrated from these four works,

as well as Beethoven's use of fugue in his variation form are discussed. This volume constitutes the refereed proceedings of the 5th Iberian Conference on Pattern Recognition and Image Analysis, IbPRIA 2011, held in Las Palmas de Gran Canaria, Spain, in June 2011. The 34 revised full papers and 58 revised poster papers presented were carefully reviewed and selected from 158 submissions. The papers are organized in topical sections on computer vision; image processing and analysis; medical applications; and pattern recognition. In October 1998 a conference was held in Lisbon to celebrate Ludwig Streit's 60th birthday. This book collects some of the papers presented at the conference as well as other essays contributed by the many friends and collaborators who wanted to honor Ludwig Streit's scientific career and personality. The contributions cover many aspects of contemporary mathematical physics. Of particular importance are new results on infinite-dimensional stochastic analysis and its applications to a wide range of physical domains. This is a detailed and data-based book showing you tried and tested methods that actually work to allow you to grow your investment portfolio, in good times and in bad. This book is not just about anecdotal ideas that occasionally work. The methods contained within this book have been tested over years of data and the results are shown. The book also contains the recipe for making that kind of data-based analysis yourself. No more costly guesswork... This is the last book on

Technical Analysis you'll ever need. "Michael has shown empirical proof of the value of patterns in the markets. Anyone who has ever used an Excel sheet will definitely love this book, as well as for other reasons. This book is easy to endorse, and we should thank him for bringing this research to our attention." - Larry Pesavento, Trade What You See, Tucson, Arizona "To really understand the financial markets, it is my view that Technical Analysis has to be included in the picture. It has always been an important tool for me." - Lars Tvede, Zug, Switzerland "Super exciting reading if you are interested in investing, both for the beginner as well as for the experienced investor. The scientific approach to the development of an investment system is very fascinating and you feel a commitment beyond the usual by the author. No doubt that when a system has to be calculated with all possible variables in order to see the consequences of them, we have here to do with something that is most thoroughly tested. This applies to both the testing of movements and the choice of the asset to be invested in. Furthermore, the author's review of his emotions in connection with his ongoing development with the investments in the market is very relevant as it is often the biggest enemy of the investor. Further, the adding on methodology described in chapter 7 alone pays for this book" - Peter Henriksen, Mijas-Costa, Spain This book is not like any other books about Technical Analysis and about making money trading. Other books tend to feature more theories than data, are more anecdotal than fact-based and they often leave the readers with more questions than answers. In this book, several methods of trading are tested on real data over months and years, so you can really see what works and what doesn't work is not only performed on historical data. The methods are fully explained, and shown in detail. After reading this book, you will be able to test your own ideas. The two volume set LNCS 6854/6855 constitutes the refereed proceedings of the International Conference on Computer Analysis of Images and Patterns, CAIP 2011, which took place in Seville, Spain, August 29-31, 2011. The 138 papers presented together with 2 invited talks were carefully reviewed and selected from 286 submissions. The papers are organized in topical section on: motion analysis, image and shape models, segmentation and grouping, shape recovery, kernel methods, medical imaging, structural pattern recognition, Biometrics, image and video processing, calibration; and tracking and stereo vision. Despite research interest in functional data analysis in the last three decades, few books are available on the subject. Filling this gap, Analysis of Variance for Functional Data presents up-to-date hypothesis testing methods

for functional data analysis. The book covers the reconstruction of functional observations, functional ANOVA, functional linear models with functional responses, ill-conditioned functional linear models, diagnostics of functional observations, heteroscedastic ANOVA for functional data, and testing equality of covariance functions. Although the methodologies presented are designed for curve data, they can be extended to surface data. Useful for statistical researchers and practitioners analyzing functional data, this self-contained book gives both a theoretical and applied treatment of functional data analysis supported by easy-to-use MATLAB® code. The author provides a number of simple methods for functional hypothesis testing. He discusses pointwise, L2-norm-based, F-type, and bootstrap tests. Assuming only basic knowledge of statistics, calculus, and matrix algebra, the book explains the key ideas at a relatively low technical level using real data examples. Each chapter also includes bibliographical notes and exercises. Real functional data sets from the text and MATLAB codes for analyzing the data examples are available for download from the author's website. This study is an analysis of the first three of Beethoven's late quartets, Opp. 127, 132, and 130, commissioned by Prince Nikolai Galitzin. The five late quartets, usually considered as a group, were written in the same period as the Missa solemnis and the Ninth Symphony, and are among the composer's most profound musical statements. Daniel K. L. Chua believes that of the five quartets the three that he studies trace a process of disintegration, whereas the last two, Opp. 131 and 135, reintegrate the language that Beethoven himself had destabilized. Through analyses that unearth peculiar features characteristic of the surface and of the deeper structures of the music, Chua interprets the "Galitzin" quartets as radical critiques of both music and society, a view first proposed by Theodore Adorno. From this perspective, the quartets necessarily undo the

act of analysis as well, forcing the analytical traditions associated with Schenker and Schoenberg to break up into an eclectic mixture of techniques. Analysis itself thus becomes problematic and has to move in a dialectical and paradoxical fashion in order to trace Beethoven's logic of disintegration. The result is a new way of reading these works that not only reflects the preoccupations of the German Romantics of that time and the poststructuralists of today, but also opens a discussion of cultural, political, and philosophical issues.
